

ASEAN IVO FORUM 2025

# TURNING CHALLENGES INTO INNOVATION WITH ICT

Arisa Siong  
Director (Tech Policy)

“ A smooth sea  
never made a  
skilled sailor. ”

*- Franklin D. Roosevelt*

# General purpose tech built on top of infra investment

**We are still early in the overall development cycle of AI**

# The Safety Disparity in AI

Investment | researchers

AI build **9:1** AI safety

## McKinsey & Company's State of AI in 2024:

% of organisations that are working to mitigate Gen AI risks (*right, below*) was generally lower than % of organisations that consider Gen AI risks relevant (*right, above*).

Gen AI risks that organizations consider relevant,<sup>1</sup>% of respondents

Gen AI risks that organizations are working to mitigate,<sup>1</sup>% respondents

<sup>1</sup>Question was asked only of respondents whose organizations have adopted AI in at least 1 function. Respondents who said "don't know/not applicable" are not shown. In 2023, n = 913. In 2024, n = 1,052.

Source: McKinsey Global Survey on AI, 1,363 participants at all levels of the organization, Feb 22–Mar 5, 2024.

# Systemic AI risks can undermine progress towards the SDGs

Systemic AI risk	SDGs most exposed	How AI risk impacts SDGs
Labor-market displacement	No Poverty (1), Decent Work and Economic Growth (8), Reduced Inequalities (10)	Rapid automation could cut income and jobs faster than social-protection and reskilling schemes can expand.
Algorithmic bias and discrimination	Reduced Inequalities (10), Peace, Justice and Strong Institutions (16)	Model-based decisions replicate structural bias, affecting marginalized groups in hiring, public services, and criminal justice.
Misinformation and disinformation	Peace, Justice and Strong Institutions (16)	Synthetic media and automated cyberattacks erode trust, destabilize elections, and endanger public safety.
Concentration of market power	Industry, Innovation and Infrastructure (9), Reduced Inequalities (10)	A few firms controlling data, compute, and frontier models limits equitable access and stifles inclusive innovation.

Systemic AI risk	SDGs most exposed	How AI risk impacts SDGs
Privacy erosion and mass surveillance	Peace, Justice and Strong Institutions (16)	Ubiquitous face recognition chills free assembly and deters civic participation.
Environmental footprint of AI compute	Affordable and Clean Energy (7), Responsible Consumption and Production (12), Climate Action (13)	Scaling models drives high energy use and e-waste, increasing emissions and resource depletion.
Autonomous weapons and escalation	Peace, Justice and Strong Institutions (16), Partnerships for the Goals (17)	Lowering the barrier to lethal force undermines arms-control regimes and raises conflict-escalation risk.
Safety and control failures ("misalignment")	Cross-cutting (all SDGs)	Unpredictable model behavior in finance, infrastructure, or security can trigger cascading systemic shocks.

# Cultural bias in the output of generative AI

## Inglehart-Welzel world cultural map with 107 countries and the GPT-family.

On the x-axis, negative values represent survival values and positive values represent self-expression values. On the y-axis, negative values represent traditional values and positive values represent secular values.

Without cultural prompting, the GPT models' (red) cultural values are most aligned with the cultural values of countries in the Anglosphere and Protestant Europe.

Southeast Asian countries marked on the map are highlighted in green.

# Next gen connectivity: Enabling the future

## Invested ahead with Nationwide Broadband Network

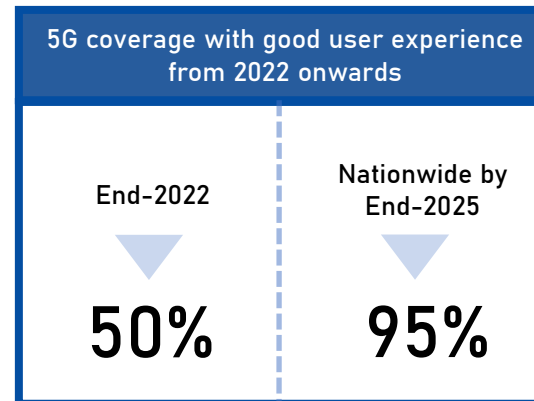

### 1<sup>st</sup> Gen NBN in 2006

- \$1bn govt investment
- 85% of residential homes on at least 1Gbps
- Competitive pricing: \$30/month

### 2<sup>nd</sup> Gen NBN in 2024

- \$100m govt investment
- >500k expected to upgrade to 10Gbps by 2028

## Amongst the first in the world to roll out 5G SA networks in 2020

3.5 GHz , 2.1 GHz – Wide area coverage

mmWave – Localised coverage

## Supporting trials to commercialisation

### \$70m funding

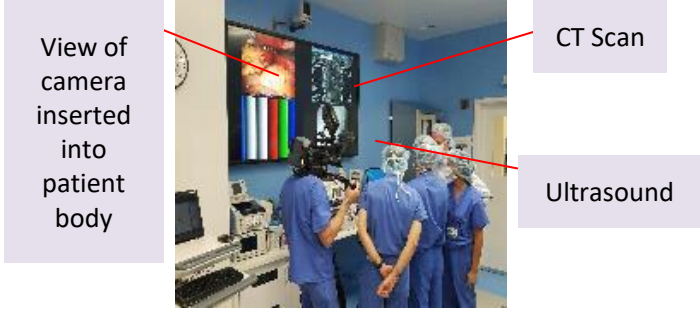

- Tranche 1 (2019) technical trials
- Tranche 2 (2021) accelerate commercial adoption of 5G

# PSA - Leveraging 5G to facilitates AGV operations, meeting PSA's business ambition of an unmanned port

	Today	Future	Key insights
	 <p>AGVs</p>	<div>  <p>More AGVs</p> </div> <div>  <p>aECH</p> </div> <div>  <p>aRTG/RMG</p> </div> <div>  <p>Mobile Surveillance</p> </div> <div>  <p>Container tracking</p> </div>	<ul style="list-style-type: none"> <li>- PSA is scaling in size and moving towards becoming a fully unmanned automated port.</li> <li>- New automated and connected devices will eventually be deployed at the port, each with unique bandwidth and latency profiles.</li> <li>- A secure, reliable network with dedicated capacity is required to sustain the growing number of connected devices.</li> </ul>
# of AGVs deployed	300 AGVs	<div> <div>Increase 6x</div> <div>→</div> </div> 2,000 AGVs (on 5G)	
Types of devices deployed on 5G	AGVs (Automated Guided Vehicles)	AGVs (Automated Guided Vehicles) aPM (autonomous Prime Mover) aECH (automated Empty Container Handler) aRTG (automated Rubber Tyred Gantry) Mobile surveillance Container tracking systems	<p><b><u>As such, 5G is key to provide:</u></b></p> <ol style="list-style-type: none"> <li>1. Increased bandwidth to support growth in connected devices.</li> <li>2. Network slicing to ensure efficient and secure management of diverse device profiles.</li> <li>3. Network resilience to support the 24x7 critical business operations.</li> </ol>

# NUHS: Leveraging 5G facilitates to guide surgeries in real-time to meet NUHS's ambition of a smart hospital

	BAU	With 5G (Mixed Reality)
	 <p>View of camera inserted into patient body</p> <p>CT Scan</p> <p>Ultrasound</p> <p><i>Disparate sources of surgical information used during surgery</i></p>	 <p><i>Surgeons utilising Mixed Reality (MR) during thoracic surgery</i></p>
Surgical information	Multiple disparate sources of information (video feeds, CT scans, and ultrasound)	Consolidated information from multiple sources (CT scans, ultrasound)
Viewing of surgical information	2D Information viewed across multiple screens and disjointed from patient	Information is unified and overlaid onto the patient with exact representation in 3D
Surgical procedures	Pre-surgery, camera inserted into patient's body to pinpoint the diseased area	Not required

## Key insights

- Current practice only provides an approximate location of diseased areas, requiring invasive procedures (e.g. camera inserted into patient)
- MR technology enables precise identification of diseased area, which is highly valuable to junior surgeons, offering enhanced guidance during complex procedures.

## 5G as a key enabler for MR

- 5G's low latency (with MEC) enables real time rendering of realistic 3D objects in concert with movements of users MR headset, to reduce the likelihood of motion sickness.

# QuikBot: Leveraging 5G for Autonomous Mobile Robots (AMR) in dense urban areas

	BAU	With 5G
	 <p><i>Interruption of AMR navigation in complex situations</i></p>  <p><i>AMR require onsite operator for exception handling</i></p>	  <p><i>Cloud processing to enhance AMR navigation</i></p>  <p><i>Command centre for remote Teleoperations</i></p>
AMR processing infrastructure	Limited AMR On board processing	Cloud-based to supplement AMR onboard processing for enhanced intelligence
Navigation abilities	Limited ability to process complex environments, leading to interruptions during navigation (Stop-Go-Stop)	Enhanced ability to detect scenes and objects (with cloud processing), AMR can detect and navigate complex environments
Intervention for exception handling	Onsite intervention required to pilot AMR out when stuck	Remote Teleoperations (via command centre) to pilot AMR out
Task completion	Prolonged due to continuous interruptions and manual intervention	Reduced due to enhanced navigation and remote Teleoperations
Manpower required	1 operator to 1 building cluster (increased manpower overhead)	1 operator to 6 building clusters (reduced manpower overhead)

## Key insights

- Due to AMR price points, most have limited intelligence for effective autonomous navigation capability. As such we often see interruptions to AMR operations in complex environments or manual interventions, when it gets stuck.
- Augmenting AMR with cloud processing enables effective navigation, reducing operational manpower and enabling higher delivery completion rates.

## 5G as a key enabler for AMRs to operate effectively

- Independent navigation: Quicker 2-way communications (video/image feeds from AMR to cloud)
- Remote teleops: Access near real-time displays and controls AMR remotely for quick response in exception situations

“ In this era of rapid digitalization, it is essential that we shape digital transformation in an inclusive and sustainable manner. ”

- ASEAN Secretary-General  
- Kao Kim Hourn
